

An Open Source, Distributed,
Transactional Graph Database

Agenda

- Data in the internet Era
- Battling the Data Complexity
- Dgraph & Its Architecture
- Demo
- Questions

Hello!

I am Aman Mangal

Distributed Systems Engineer

Dgraph Labs

@mangalaman93

Data in the Internet Era

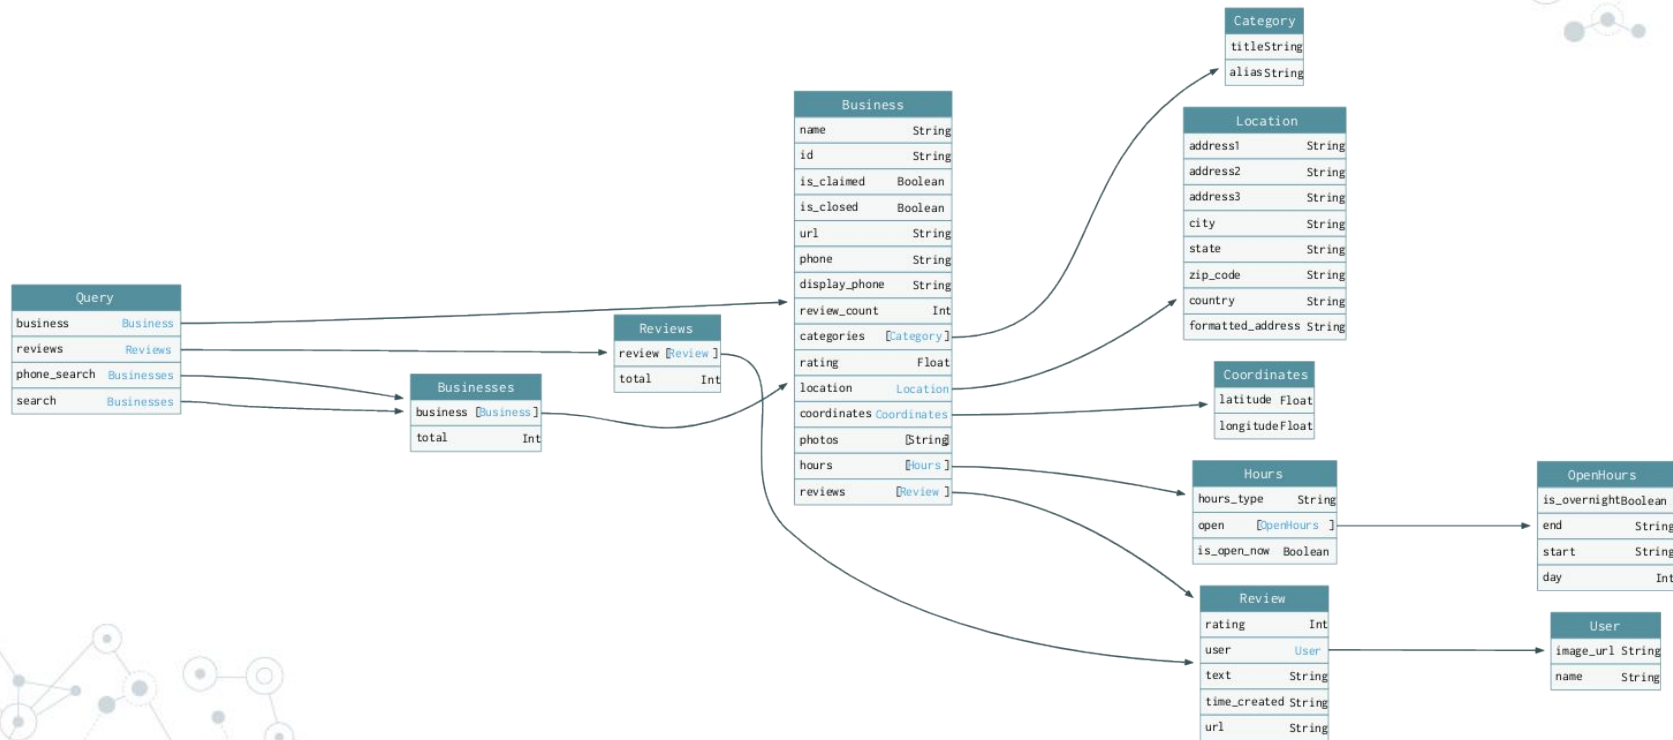

A decorative network diagram in the bottom-right corner, featuring a complex web of interconnected nodes and lines, with some nodes highlighted in blue and others in grey.

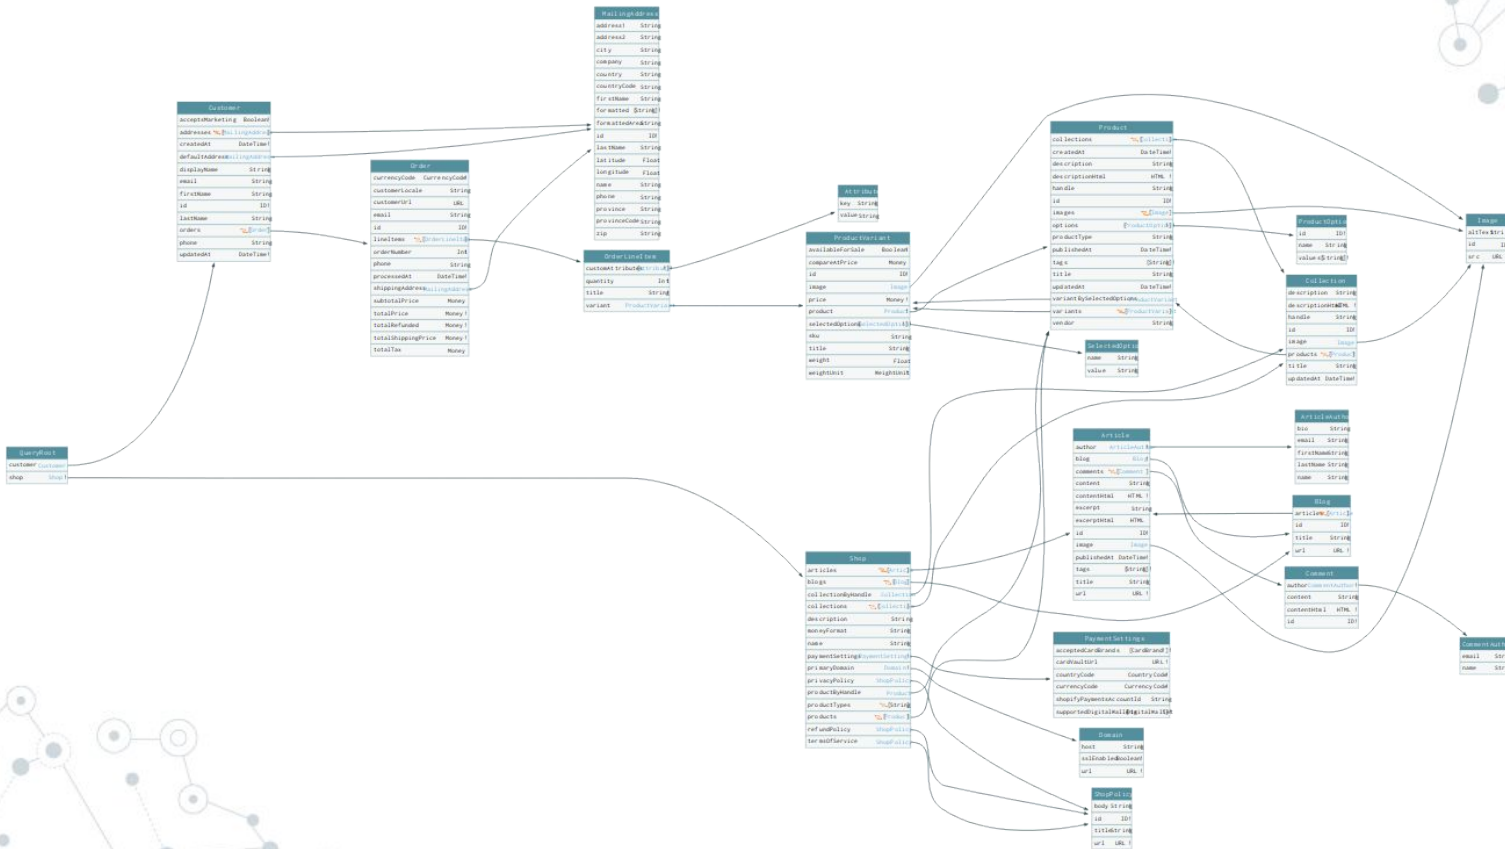

“

*Data is not just growing in size,
but also in its complexity and
connectedness.*

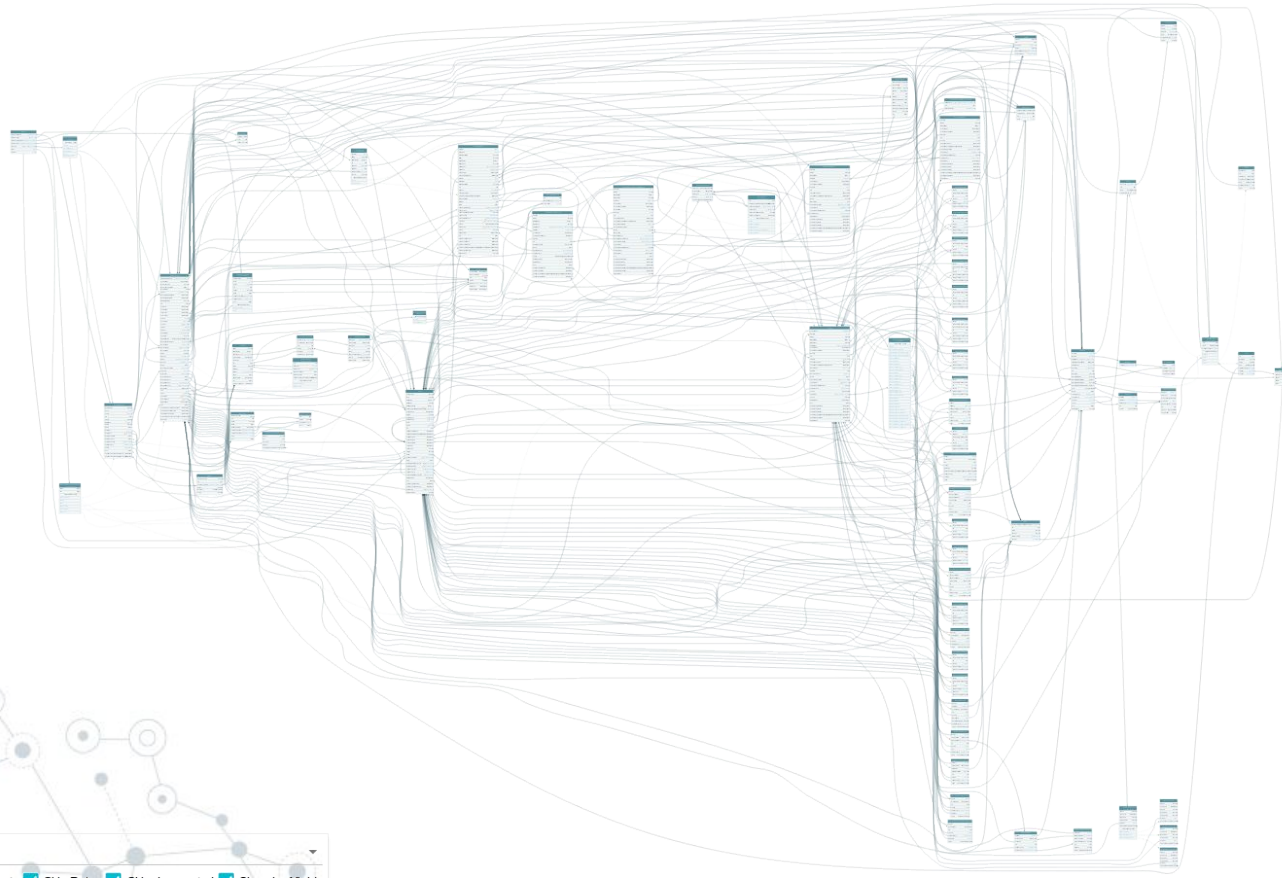

Complex Dataset: Yelp (1)

Complex Dataset: Ecommerce (2)

Complex Dataset: GitHub (3)

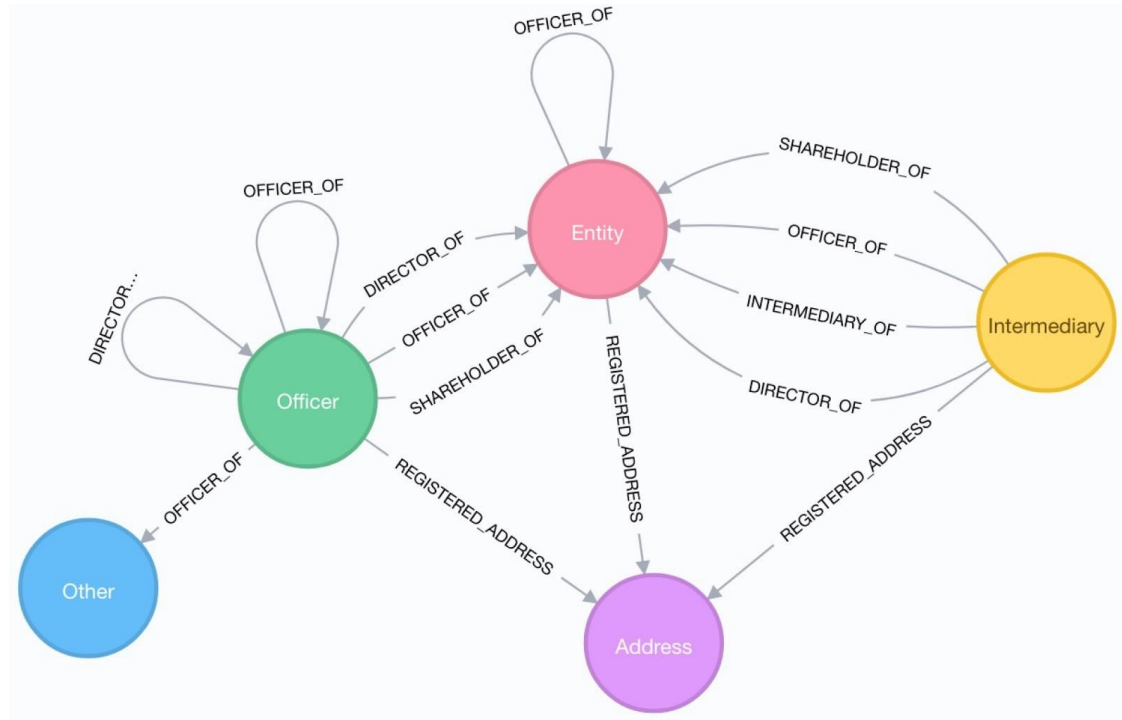

“

Unearthing the complex relationships in data could reveal a lot of interesting facts.

Fraud Detection

2.

**How does applications
deal with
such datasets?**

SQL Database

Order ID	Customer ID	Order Date
101	201	2019-10-15
102	202	2019-10-16
103	201	2019-10-17

Customer ID	Name	Location
201	Aman	Bengaluru

202	Karthik	Mumbai
Order ID	Status	Timestamp
101	New	1571144739

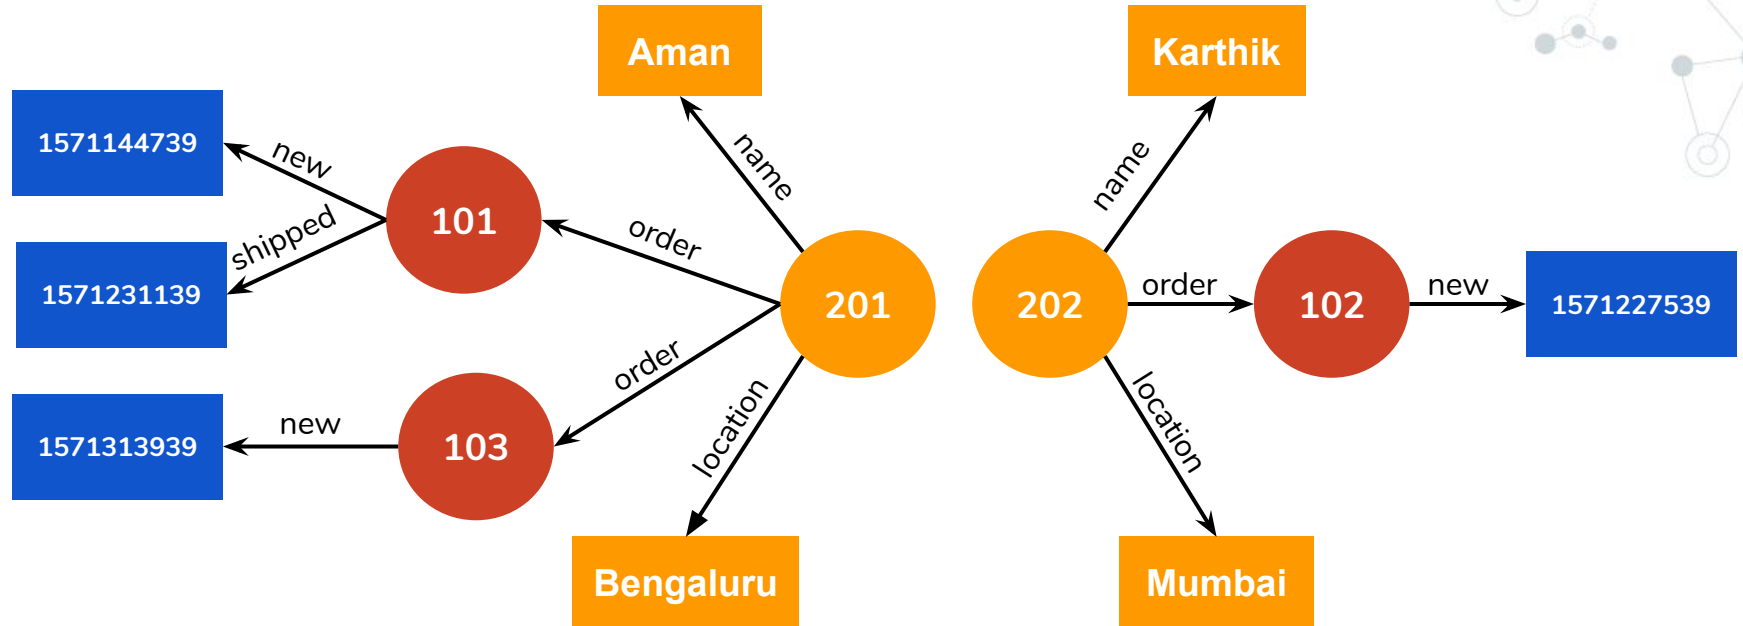

101	Shipped	1571231139
102	New	1571227539
103	New	1571313939

NoSQL Database

Key	Value
201	{“name”: “Aman”, “location”: “Bengaluru”}
202	{“name”: “Karthik”, “location”: “Mumbai”}

Key	Value
101	{“customer”: 201, “date”: 2019-10-15, “new”: 1571144739, “shipped”: 1571231139}
102	{“customer”: 202, “date”: 2019-10-16, “new”: 1571227539}
103	{“customer”: 201, “date”: 2019-10-17, “new”: 1571313939}

Graph Database

“

*But we need a Graph
Database that is scalable,
performant and resilient.*

3.

Welcome to Dgraph

A State of the Art Graph Database

Dgraph (github.com/dgraph-io/dgraph)

An **open source** graph database built for web scale production environments written in Go.

- ◎ Fast & horizontally scalable
 - ◎ Highly available by design
 - ◎ Fault tolerant
 - ◎ Sharded and distributed (joins, filters and sorts)
 - ◎ Client side transactions
 - ◎ Consistent replication with Raft
-

Distributed & Horizontally Scalable

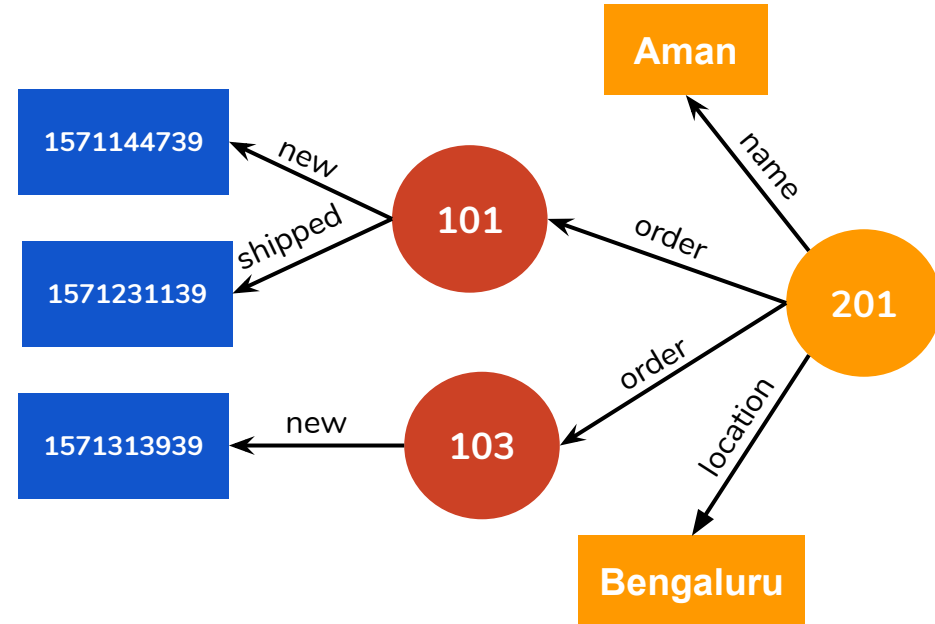

Ratel: Web UI

Alpha: Data Storage

Zero: Cluster Management

Data Sharding (1)

- Vertex cut partitioning
- Data for one type of edge is stored together (i.e. *order* edges)

Data Sharding (2)

- Allows efficient graph traversal, single network call for one hop traversal

Client Side Transactions

- ◎ Dgraph provides a consistent view of data for each client for the duration of transaction (snapshot isolation)
- ◎ Ensures consistency using Raft consensus algorithm when concurrent transactions are running

```
txn := client.NewTxn()  
...  
// perform queries  
// or mutations  
...  
txn.Commit()  
// or txn.Abort()
```

Strong Consistency

- ◎ Dgraph supports Linearizability
- ◎ Changes are immediately reflected to majority of replicas in the system
- ◎ Everyone sees consistent view of the data
